

## Calendar and Readings (July 4)

---

### **Lecture 1**

The reading for today is the keynote address that my Stanford colleague Terry Winograd delivered at the National Conference on Computing and Values in 1991. Ordinarily, you should complete the readings before the class in question, but doing so is clearly impossible for the first class.

### **Lecture 2**

I'm planning to spend this lecture providing a brief definition of what information assurance/information security is. Because we'll be using many examples from information security throughout the class, I'd like everyone to have a basic degree of comfort about what information security entails. I have provided two readings – basically, the introductory chapters from two of the better Computer Security books available, by Matt Bishop and by Ross Anderson. I'd like you to read at least one of them. If you do read both, and have an opinion about which one I should use in the future, please let me know!

### **Discussion sections**

There is no discussion section for today.
